

The Quick Summary

You have nothing to worry about. Your eye symptoms are not an actual eye issue but are happening due to migraines. If you start getting frequent migraines, we will need to get your regular doctor involved.

Migraines

Migraines can have a wide variety of effects on the eye. The most common changes involve zigzag bright lights or dark areas in the vision, but there are lots of different types of eye and vision changes that can occur with migraines.

Even if you have had migraines before without any eye or vision changes, these new symptoms are still most likely related to migraines. It is pretty common for patients to have migraines without eye/vision problems for years before developing migraines with such problems. **It is also very common to have migraine eye/vision problems WITHOUT headaches.**

If you have infrequent migraines, you most likely don't need any treatment for these. If you have had migraines before but are suddenly having eye/visual symptoms, you don't need any additional treatment because of these new symptoms. However, if your migraines start happening with increased frequency, we might need to get your regular doctor involved. Your primary care provider might recommend doing a scan of your brain if that happens.
